

Note 1: Income vs. Inflation Dynamics

Analysis of historical Federal Reserve data against industry earnings shows a distinct relationship between wage growth and inflation. The peak inflation rate reached 13.5%, categorizing the economic environment as "High Risk." During high inflation periods (>4%), industries such as Utilities and Management maintained the highest average incomes, demonstrating sector resilience against macroeconomic stress.

Note 2: Industry Job Growth & Market Share

The US job market is heavily concentrated in a few primary sectors. As of the most recent census data, Government and Health Care sectors are the dominant employers. The top 5 industries account for over 60% of the total workforce tracked, indicating massive consolidation of job opportunities outside of traditional manufacturing or agriculture.

Conclusions:

- 1. **Purchasing Power:** While average industry income has nominally increased over the decades, steep spikes in inflation periodically erode real purchasing power.
- 2. **Career Stability:** For job seekers prioritizing economic stability, the data suggests targeting sectors like Healthcare and Public Administration, which not only hold the largest market share but show consistent long-term growth regardless of short-term inflation volatility.
